Skuffers in all sizes for Lads and Lassies at Moderate Prices

RYAN & STENSON

PERSONAL

Ross Congdon, the Goldfield mining man, is in town.

Bob Gilbert returned yesterday from a visit to Salsbury Wash district.

Jack Salsberry, of the Tonopah Lumber company, arrived yesterday from Reno.

General Manager S. H. Brady of the Belmont returned yesterday from a business trip to San Francisco.

Fred Slebert, consulting engineer for George Wingfield, paid a visit to Salsbury Wash yesterday, returning last evening.

Walter C. Lamb returned yesterday from an extended visit through the east and will continue on to Manhattan in a few days.

F. G. Waterhouse, general manager of the Nevada Consolidated Telephone and Telegraph company, is back from a visit to the southern end of the county.

Mr. and Mrs. William Madigan and family of Round Mountain, who have been visiting in Tonopah for the past week, left on yesterday morning's train for Salt Lake.

Mrs. Martin Roche and daughter, Miss Mayme Roche, of Chicago, arrived in Tonopah yesterday and will visit here for some time with their daughter and sister, Mrs. J. C. Piercy.

NOTICE TO VOLUNTEERS

Hereafter the regular meeting of the Tonopah volunteer fire department will be held every Wednesday instead of Thursday evenings. Class nights will be Monday and Thursday instead of Tuesday and Friday.
J. S. MULLINS, Rec. Sec.
W. L. MOORE, President.

POISON TO FIGHT POISON; IS NEW THEORY APPLIED

GOLDFIELD, May 25.—An experimental case at the hospital in charge of Dr. D. A. Turner, county health officer, is attracting exceptional interest among the members of the medical fraternity. It consists, simply, in fighting a cancerous growth by erysipelas serum. The proposition was broached in New York City about a year ago, and is said to have been productive of good results. This is the first time the system has been tried in Nevada and the consequence will be of vast importance to the fraternity.

A well known resident of Goldfield has cancer of the face, the affection extending over one entire side of his face. Developed to the extent that it has, the cancerous growth will, it is claimed, prove fatal within a short time unless checked. The theory is that by injecting the erysipelas serum into the cancer, the cell formation, which is the basis of cancer, will be retarded, and that the anti-toxin in the patient's system will further retard the growth of these cells. The remedy used is known as Dr. Coley's mixture of the germs of erysipelas and prodigious. The initial treatment consists of only a quarter of a drop a day. The patient in Goldfield yesterday had a full drop given him and it is said that the results are satisfactory to date. Cancer, developed as is this present case, is inoperable and the new theory is applied as a last resort.

The "Casey Jones" two-step will be introduced Saturday night at the Big Casino.

For a nice large glass of cool beer and free lunch drop in the Nevada Club.

WEEK'S DEVELOPMENTS IN DEEP WORKINGS OF THE TONOPAH MINES

MONTANA-TONOPAH.

The Montana mill treated 955 tons of ore during the past week. In the mine the workings were extended 293 feet.

396 level—The west drift on the Triangle vein advanced sixteen feet and the face shows it to be considerably broken up. As a whole it is not big enough to mill. From appearances the face has apparently reached a fault. The footwall crosscut, driven from under the central portion of the Triangle stope, advanced thirteen feet and has cut about two and one-half feet of fair milling ore. This is probably the same ore body encountered in the footwall crosscut of the stope above. During the week stoping was confined to the east and west end of the Triangle stope. In the west end the vein averages about three feet of a fair grade milling ore. The east end on the fault averages about two feet of good oxidized ore. The central portion of the stope is now filled with waste and is ready for a large production.

462-foot level—The west drift on the Triangle vein advanced twelve feet and is in good milling ore, the face showing the vein for about three feet in width. The stope above this drift at a point fifty feet back from the face has an average of one and one-half feet of a fair grade milling ore. The stope on the Martha vein above the level shows no change, the vein averaging two and one-half feet of milling ore. On the Macdonald vein, 1000 feet west of the shaft, the intermediate drift between the second and third levels, has been driven ahead forty-six feet to where the vein is exposed for a width of about three feet of good milling ore of a sulphide character.

515-foot level—The east drift on the Martha vein advanced fourteen feet and the face shows about two and one-half feet of milling ore. The raise on this vein, about 100 feet from the face, advanced twelve feet and the vein at the top has narrowed down and is somewhat poor in quality. In the central portion of the stope on this vein very little work has been done, as the stope is being carried over the west drift where the vein is exposed and will average about three feet of very good milling ore. The west drift on the South vein was advanced fourteen feet, the face showing about two feet of good milling ore. The stope over the drift produced some good ore during the past week and shows the vein averaging between three and four feet in width.

565-foot, intermediate level—The west drift on the South vein advanced nineteen feet and shows about two feet of milling ore. The east

drift on the Martha vein advanced seventeen feet. The face shows some very good ore but the vein is still broken up.

615-foot level—The crosscut west from the main south crosscut, advanced thirty-two feet and made connection with the winze on the Martha vein from the 515-foot level. The crosscut is being continued into the footwall of the winze to prospect the vein. The intermediate drift on the Midway No. 2 vein about 600 feet west of the shaft, advanced fifty-four feet. The vein in the face is about eighteen inches in width, showing low grade mill ore. The stopes on this level remain unchanged.

765-foot level—The main crosscut north advanced nineteen feet and is now out 1183 feet from the shaft. The face shows no change.

TONOPAH MINING.

The shipments for the week from the Tonopah Mining company to the Desert mill at Millers aggregated 3400 tons. The mill report shows that of the 100 stamps, an average of ninety-six were dropping during the week. The ore milled totaled 3300 tons of an average value of \$21.50. Twenty-two tons of concentrates were shipped to the smelters, which were valued at \$350 per ton. Fifty-four bars of bullion was the result of the run, the bars being valued at \$824 each or a total value of \$44,496. The recovery averaged 90 per cent.

In the workings of the mine 164 feet of development work was recorded, thirty-five feet in the Silver Top, 113½ feet in the Mizpah and fifteen and one-half feet in the Red Plume. Work was somewhat delayed in the Silver Top owing to the air compressors being over taxed. Another compressor has been ordered and is on the way. At the present two compressors are furnishing the power and have a capacity of between forty and fifty drifts.

No progress was made in the Red Plume shaft owing to the station at the bottom being timbered. The Mizpah shaft was extended six and one-half feet with no change in the formation. The work of circling the shaft at the 1380-foot point has been completed and nearly all the water flow is turned into the crosscut where a No. 5 Smith-Vaile sinking pump has been installed to force the water to the pump level. A No. 7 Cameron is used as a sinker in the bottom of the shaft. This has a capacity of 100 gallons per minute.

240-foot level, Silver Top—A raise has been started on the ledge cut by the south crosscut from the shaft. The back shows from two to three feet of low grade ore.

340 and 440-foot levels—The reg-

ular work is being conducted in the stopes on the Valley View vein west of the shaft and on the Silver Top vein east of the shaft.

540-foot level—A west drift has been started on a narrow stringer of ore cut by the south crosscut from the main west drift.

Mizpah, 200-foot level—The raise being sent up on the ledge cut by the south crosscut from the main drift, continues to show from three to four feet of milling ore. The new drift under the Mizpah fault was sent ahead during the week on one foot of ore.

400-foot level—The northwest drift under the Mizpah fault has been sent ahead on a formation somewhat broken up, showing some quartz but carrying no values.

500-foot level—The east drift from the south crosscut from the main west drift was sent ahead the usual distance, and shows from one to two feet of quartz which in spots carries values but as a whole is of a poor grade.

600-foot level—A west drift has been started on a quartz vein that was exposed by the north crosscut at the extreme west end of this level, connecting with the Red Plume shaft. The face shows the vein to be from two to three feet in width and of a low grade quality.

BELMONT.

The only surface operations now under way at the Belmont is being conducted at the old Belmont shaft where everything is being placed in readiness preparatory to the sending down of a churn drill from the bottom of the shaft to the 1000-foot level. The shaft is now being bailed, but the work is somewhat slow owing to the fact that the hoist can be run only after the day and night shifts have finished their labors, owing to the shortage of compressed air which is necessary to operate the engine. The air is furnished from the compressors at the Desert Queen shaft.

On the 900-foot level of the Desert Queen, stoping on the South vein where about one and one-half feet of good milling ore is being shot down.

1000-foot level—The stope on the South vein remains unchanged and is showing about three feet of good milling ore. Raise No. 1 from the west drift on this vein has made connections with the 900-foot level and a better ventilation in this section of the workings is afforded. The west drift on this vein has been discontinued for the present, the face showing about one foot of low grade ore. The south crosscut 1003 to the east and south of the ore made the

usual progress and the face shows quartz of low grade.

Intermediate, 1056-foot level—The east drift No. 2 has been driven through the fault, which displaced the vein. The fault at this place proved to be about thirty-five feet in width. A north crosscut is being driven through the hanging wall side for the purpose of prospecting for veins.

1100-foot level—The east drift from the 1056 winze shows about two feet of good milling ore. The face of the drift is split into three walls, the hanging wall, a false wall and the real footwall, and it is between the hanging and false wall that the pay streak lies. Between the two footwalls there is a gouge matter that varies in width from two inches to two feet which carries little values and indicates a great

(Continued on Page 4.)
